habiPEt — Design Justification

MTM4186 Mobile Programming | Individual Project | Milestone Submission

---

1. Design concept and purpose

habiPEt is a gamified habit-tracking mobile application that connects personal routines with a virtual pet. Users create habits, track daily completion, earn rewards and use these rewards to care for their digital companion. The design aims to make consistent habit formation feel approachable, encouraging and rewarding rather than punitive.

2. Target users and user experience

The primary audience is students and other users seeking a simple way to maintain everyday routines. The central actions - reviewing today's habits, creating a habit, marking it complete and checking progress - are intended to be easy to locate. Brief labels, predictable navigation and prominent feedback help users understand the result of each action.

3. Color palette

The visual direction combines sage green, cream and restrained gold accents. Sage green is the primary action and progress color; cream creates a softer base; gold communicates earned rewards and achievements. Backgrounds and cards are differentiated by tone, with dark text on light surfaces. A dark appearance is planned for future development; final contrast ratios must be verified on the implemented screens.

4. Typography and visual hierarchy

A clean sans-serif typeface, Inter in the current design concept, supports readable headings and compact habit information. Type size, weight and spacing distinguish screen titles, card headings, descriptions and button labels. A small number of consistent text styles is preferred over decorative typography.

5. Layout and navigation

The interface uses Material 3-inspired rounded cards and a consistent bottom navigation structure. The main dashboard groups daily habits and a pet preview. Dedicated screens provide habit creation, pet care, calendar-based progress, achievements and profile settings. A seven-screen design set includes the welcome screen. Repeated card spacing and action placement support learnability.

6. Gamification and feedback

Completing eligible habits contributes to progress and rewards. A badge system highlights milestones such as 7, 14 and 21 days of consistency. Earned resources can be spent to feed the pet, and feeding contributes to its level progression; the pet's age instead reflects time spent using the application. This separation keeps the reward model internally consistent. The intended experience uses positive feedback rather than penalties.

7. Accessibility and inclusive design

The design calls for readable contrast, clear labels, generous touch targets and feedback that does not depend exclusively on color. Status changes should be expressed through text or icons as well as color. Interaction states, dark-theme contrast and screen-reader naming will need implementation-stage review and testing.

8. Scope and conclusion

This milestone presents an initial product design and architectural plan, not a claim that a complete Flutter application has been implemented. The wireframes, high-fidelity mockups and navigable Figma prototype demonstrate the principal user journey. habiPEt's visual decisions support a consistent, friendly and manageable habit-tracking experience.
